Addressing health issues among underserved communities in isolated areas

Indosat Ooredoo assists underserved communities in remote and isolated areas and victims of natural disasters by addressing their health issues through its Mobile Clinic program.

With regard to health problems, underserved communities living in remote and isolated areas are not as fortunate as those living in urban areas. In Indonesia, 100,000 health facilities serve up to 100,000 people. On top of that, most villagers living in hard-to-reach areas are community-based primary health care centers. Healthcare services on the country’s rural areas are often limited, and due to cost, people have to bear the costs of medical treatment which are often not covered by insurance. It is a bit of a trial and a lot of them cannot afford to pay for the costs of medical treatment and end up not seeking medical care. In remote and isolated areas, due to poor road and communication networks, medical care, vaccinations, and vaccinations are not easily accessible due to distance, lack of infrastructure, and transportation.

The number of pregnant women in Indonesia is in the hundreds of thousands, and many live in remote and isolated areas. Pregnant women have to make extra efforts to get healthcare and medical facilities, as medical care is not available there. If they have complaints, they have to make an extra effort to get to a puskesmas due to poor road conditions. On top of that, healthcare facilities in the villages are not always equipped with basic medical tools and equipment, making it difficult for pregnant women to get proper medical assistance.

The cost of medical treatment is another issue. Many pregnant women cannot pay for medical facilities, and have to go through their own funds in order to get proper medical treatment. Pregnant women have to make extra effort to get assistance from a hospital due to their economic situation. In remote and isolated areas, where there’s no healthcare facilities, pregnant women have to travel long distances to reach the nearest hospital, which can take up to two or three days.

In Indonesia, there are two main programs that assist pregnant women, and mobile clinic from Indosat Ooredoo.

The program has been implemented since 2015, and has served more than 50,000 patients so far. The program has been successful in providing medical assistance to pregnant women in remote and isolated areas. The program has been implemented in areas such as East Nusa Tenggara, West Nusa Tenggara, South Sulawesi, and West Kaimana Islands.

The program works by providing medical assistance to pregnant women in remote and isolated areas. Pregnant women in these areas have access to medical facilities, such as hospitals and health centers, where they receive proper medical assistance. The program has been successful in reducing maternal deaths and improving the health of pregnant women in remote and isolated areas. The program has also been successful in reducing the number of stillbirths and low birth weight babies. The program has been successful in providing medical assistance to pregnant women in remote and isolated areas, and has been successful in reducing maternal deaths and improving the health of pregnant women in remote and isolated areas.
